FLIIPTECH SKILLS HUB

A marketplace that helps people in Ghana find practical skills training, and helps small workshops get found.

Prepared for	Felix Padi, Founder
Parent business	Fliiptech Engineering Solutions
Scope of this document	Version 1 product, interface and technology plan
Launch market	Greater Accra
Frontend	Next.js 16.3 with React 19.2
Backend	Django 5.2 LTS with PostgreSQL and PostGIS
Status	For review and costing, not yet a build contract

SECTION 01

About this document

This document describes what version 1 of Fliiptech Skills Hub should be: the screens, the technology, the data it holds and the order in which it should be built. It exists so that a developer can quote against a fixed scope, and so that the scope itself can be argued with before anyone writes code.

The screens shown here are working design mockups rendered from real markup. They are not photographs of a finished product. Every provider name, fee and figure in them is illustrative and was invented for the purpose of showing layout.

Three things are deliberately outside the scope of this document. It does not set a price for the build, because that depends on who builds it. It does not repeat the financial model from the investor proposal. It does not attempt to validate demand, which remains the founder action item that everything else depends on.

The one assumption everything rests on

This design assumes workshop owners will not maintain their own profiles at first. Every screen, and the whole admin plan, is built around a Fliiptech staff member creating and updating provider profiles on the owner's behalf, from a phone or tablet, during a site visit. If that assumption is wrong the product gets simpler. If it is right and the build ignores it, the marketplace fills with stale listings within a quarter.

SECTION 02

What version 1 is

Version 1 is a mobile-first web application with a staffed back office. A person searching for training can find providers near them, compare what the training costs and how long it runs, see what has been checked about the provider, and send one enquiry. A workshop owner can see the enquiries they received and what they are getting for their subscription.

CAPABILITY	IN VERSION 1	NOTES
Search and filter providers	Yes	Trade, area, fee ceiling, next intake, verified only
Distance from the user	Yes	Radius search from a chosen point
Map view with provider pins	Yes	Secondary view, the ranked list stays the default
Provider profile with photos	Yes	Fees, duration, schedule, trainer, intake dates
Verification record	Yes	What was checked, when, and by whom
Government status shown separately	Yes	Displayed exactly as documented, never inferred
Enquiry to provider	Yes	Structured form, then handover to WhatsApp
Provider dashboard	Yes	Enquiries, views, response rate, enrolments
Staff back office	Yes	Onboarding, verification queue, moderation, audit trail
Public pages built for search engines	Yes	One page per trade and area combination
Online payment of course fees	No	Deferred until enrolment volume justifies it
In-app messaging	No	WhatsApp carries the conversation
Reviews and ratings	No	Needs enrolment volume first, or it invites abuse
Native Android and iOS apps	No	Year 2, and only if web usage justifies it
Employer and apprenticeship matching	No	Year 2, but see section 08 for what version 1 must capture now

Why the exclusions matter

Each excluded item is excluded for a reason that should survive a conversation with an investor. Payments add a licensing and reconciliation burden before there is anything to reconcile. In-app messaging competes with WhatsApp and loses. Reviews on a marketplace with forty providers are a reputational liability, not a trust signal, because a single bad actor can move a provider's average with two reviews. Native apps cost more than the entire web build and reach fewer people than a link that opens in a browser.

SECTION 03

Who uses it, and what they are trying to do

USER	WHAT THEY WANT	WHAT WOULD MAKE THEM GIVE UP
Trainee, 18 to 30, Android phone, prepaid data	To find out what a course near them costs and when it starts, without calling six numbers	A page that loads slowly, or a listing with no fee shown
Workshop owner or master craft person	More enquiries from people who actually turn up, with no work on their part	Being asked to log in and maintain a profile, or paying for leads that never enrol
Fliiptech field officer	To create a complete provider profile during one site visit, on a phone	A back office that needs a laptop and a good connection
NGO or institutional programme officer	A shortlist of providers that can take a cohort of beneficiaries	No way to filter by capacity or to export a list

The two-sided problem in one sentence

A trainee will not use a directory with fifteen providers, and a provider will not pay for a directory with no trainees. Version 1 resolves this by making the trainee side free and immediately useful at low provider counts, through tight geographic focus, and by giving providers free listings until the enquiry volume is provable. Nothing in the software solves this. The software only needs to avoid making it worse.

Design consequence

Because the trainee side must feel useful at forty providers rather than four hundred, the search results show fee, duration and next intake on the card itself. At low inventory, depth of information is the substitute for breadth of choice.

SECTION 04

The screens

Six screens carry version 1. Five are the mobile web app, one is the public page that search engines index. The mockups below are rendered at actual proportions for a mid-range Android handset.

SCREEN 1 OF 6

Search results

The default view. Trade filters run across the top, and results are ordered by distance from the point the user chose rather than by who paid most, which keeps the ranking defensible.

Fee, duration and next intake sit on the card. This is the single most important layout decision in the product: it lets someone rule a provider out without a tap, which is what comparison actually means.

Two badges, never merged. One records the Fliiptech site visit and its date. The other records government status, and it is allowed to say that the status was not provided.

SCREEN 2 OF 6

Map view

A secondary view reached by the List and Map toggle. Photo pins show the workshop itself, which is more informative than a coloured dot when the thing being judged is a workshop.

At national zoom, dense areas collapse into a count. Greater Accra will hold most of the inventory for the first year and would otherwise obscure the map. Selecting a pin raises a card with the fee and the verification status, so the map leads back into the same comparison the list supports.

A caution worth repeating to whoever builds this: the map wins demonstrations and loses users. It must never become the default view.

SCREEN 3 OF 6

Provider profile

The screen the whole business depends on. Everything above the fold answers one question: should I trust this workshop with my money.

The verification stamp states what was actually done, in plain words, and then says outright that it is not a government accreditation. The investor proposal flags this risk twice. Here it is handled in the interface rather than in a policy document, which is the only place it reliably holds.

Government status is a separate block with its own rows, one of which can read Not claimed. A field that can say no is what makes the field mean anything when it says yes.

The programme facts are a plain list, not prose. Fee, instalments, duration, hours, intake date, places remaining.

SCREEN 4 OF 6

Enquiry sent

Confirmation with a reference the trainee can quote on the phone, and a realistic expectation of when a reply will come.

The enquiry then moves to WhatsApp. Building a chat product to compete with the one already on every phone in Ghana would be the most expensive mistake available in this project.

The closing note encourages enquiring with three providers. This is honest advice and it also multiplies the leads flowing to the paying side, which is a rare case of the two interests pointing the same way.

SCREEN 5 OF 6

Workshop dashboard

The paying side of the marketplace. A subscription renews when the owner can see what it bought, so this screen leads with the four numbers that justify the fee.

Enquiries and profile views are easy to count. Response rate is included because it changes the owner's behaviour, and slow responses are the fastest way to lose a trainee.

Enrolments, expressed in cedis of course fees, is the number that decides retention. It cannot be measured automatically, since enrolment happens offline. It has to be captured by asking the provider, which means the back office needs a way to record it and the field team needs a routine for collecting it.

If that one number cannot be produced honestly, the subscription model is in trouble and it is better to know in month four than in month fourteen.

What the dashboard implies operationally

Reporting enrolments requires a monthly touch with every paying provider. Budget for it as field work, not as a feature. It doubles as the retention conversation and as the source of the conversion data any investor will ask for during diligence.

SCREEN 6 OF 6

The public page that search engines index

This is why the frontend is Next.js rather than a plain React application. Each trade and area combination becomes a server-rendered page with its own address, heading and content. Search traffic is the cheapest demand a marketplace can acquire, and it compounds while paid campaigns do not.

What welding training costs in Accra

Across the 38 workshops listed here, full welding courses run from GHS 900 to GHS 3,200. Shorter arc-only courses of three to four months sit at the lower end. Centres that include MIG, TIG and fabrication drawing usually run six months and cost more. Most workshops accept payment in two or three instalments.

Desktop view of a generated area page. On a phone the same page stacks to a single column.

GENERATED PAGE	EXAMPLE ADDRESS	ROUGHLY HOW MANY
Trade in a region	/greater-accra/welding-training	6 trades by 16 regions
Trade in a town or area	/tema/welding-training	Grows with coverage
Individual provider	/tema/tema-community-1-welding-works	One per listed provider
Trade explainer	/trades/welding	One per trade

These pages must be genuinely useful, not thin templates with a place name swapped in. The fee range paragraph on the page shown is a real example: it is computed from the listings and answers the question people actually type into a search box.

SECTION 05

Technology decisions

Four choices shape everything else. Each is recorded here with the reason, so that a future developer can tell the difference between a decision and an accident.

Django for the backend and the back office

The deciding factor is not the API, it is the admin. Version 1 needs staff to create and verify provider profiles from day one. Django ships a production-grade administrative interface with permissions, inline editing, file uploads and a full record of who changed what. Building the equivalent on a Node stack is three to four weeks of work before a single provider is onboarded, and on this budget that is the difference between launching and not.

Geographic search is the second reason. GeoDjango and PostGIS answer the question of which providers are within ten kilometres of a point as a normal database query, correctly, with an index behind it.

Next.js 16 for the frontend

A plain React application renders an empty page to a search engine crawler, which forfeits the area pages described in the previous section. Next.js renders them on the server. It also produces a faster first paint on a mid-range Android handset, which matters more in Accra than in most markets, and it optimises the provider photographs automatically.

VERSION TARGETS, TO BE CONFIRMED AGAINST THE CURRENT RELEASE AT KICKOFF

```
next 16.3.x current release, or 16.2.x for the long-term support line
react 19.2.x bundled with Next.js 16
node 22.x LTS minimum supported runtime
```

Leaflet with OpenStreetMap for maps

Google Maps requires a billing arrangement and starts charging beyond a free allowance, which is real friction for a pre-seed company in Ghana. Leaflet with OpenStreetMap tiles is free, adequate for this use, and can be pointed at a paid tile provider later without rewriting the map. Region and district boundaries can be taken from open datasets and simplified before shipping, so that a user on a slow connection is not made to download half a megabyte of coastline.

Postgres full-text search rather than a search engine

PostgreSQL handles search well below the hundred thousand record mark. Adding a dedicated search service at this stage means another server to run, secure and pay for, in exchange for nothing a user would notice.

The decision worth revisiting

Django developers are thinner on the ground in Accra than JavaScript developers. If Felix intends to hand this to a local contractor for long-term maintenance, that is a genuine argument for a JavaScript backend, and it should be weighed before the build starts rather than after. The recommendation here assumes continuity of the original developer through the pilot.

SECTION 06

Libraries and services

Everything below is either free or has a free tier at this scale. Nothing here requires a licence purchase.

Backend, Python and Django

PACKAGE	PURPOSE
django (5.2 LTS)	Framework, admin, ORM, migrations, authentication
psycopg[binary]	PostgreSQL driver
django.contrib.gis (GeoDjango)	Point fields and distance queries, bundled with Django
djangoestframework	JSON API consumed by the Next.js frontend
django-filter	Trade, area, fee ceiling and intake date filtering
drf-spectacular	API schema, so the frontend developer is not guessing
django-cors-headers	Cross-origin access for the frontend
django-environ	Configuration from environment variables
Pillow, django-imagekit	Image handling, thumbnails and WebP variants on upload
django-storages, boto3	Media storage, pointed at Cloudflare R2
django-phonenumbers-field, phonenumbers	Ghanaian phone number storage and validation
django-otp	One-time codes by SMS, since most trainees have no email address
django-simple-history	Change history on providers and verification records
django-axes, django-ratelimit	Login throttling and enquiry spam control
celery, redis, django-celery-beat	Background jobs and scheduled data-freshness prompts
django-redis	Caching of search results and generated pages
gunicorn, whitenoise	Application server and static file serving
sentry-sdk	Error reporting from production
pytest-django, factory-boy, faker	Tests and realistic fixture data
ruff, black	Linting and formatting
django-debug-toolbar	Query inspection during development

Frontend, Next.js

PACKAGE	PURPOSE
next, react, react-dom	Framework and rendering
typescript	Type safety across the API boundary
tailwindcss	Styling
leaflet, react-leaflet	Map rendering
leaflet.markercluster	Grouping dense pins at low zoom
@tanstack/react-query	Data fetching, caching and retry on poor connections
react-hook-form, zod	Enquiry form handling and validation
next/image	Provider photograph optimisation, built in
@fontsource packages	Self-hosted fonts, so the app does not depend on a font service

Infrastructure and third-party services

SERVICE	USED FOR	ROUGH COST AT PILOT SCALE
Hetzner Cloud, Helsinki or Falkenstein	Application and database server	About 10 to 20 euro a month
PostgreSQL 16 with PostGIS	Database, on the same server initially	Included
Cloudflare R2	Provider photographs	Free tier covers the pilot
Cloudflare CDN and DNS	Caching and TLS	Free tier
Vercel or the same server	Next.js hosting	Free tier, or included
Arkesel or Hubtel	SMS one-time codes and notifications, Ghana rates	Per message, low
WhatsApp Cloud API, Meta	Enquiry handover and provider alerts	Free tier, then per conversation
Paystack	Payments, when introduced, supports mobile money	Percentage per transaction
Sentry	Error monitoring	Free tier

On server location

A European server adds roughly 150 milliseconds of latency for Ghanaian users. That is acceptable and is the usual trade, since African hosting is more expensive and less reliable. Putting Cloudflare in front means most page assets are served from a nearby edge location regardless.

SECTION 07

Data model

Nine tables carry version 1. The shape below is what the interface in section 04 requires, plus two fields that cost nothing now and are irrecoverable later.

TABLE	HOLDS	POINTS WORTH NOTING
Provider	The workshop or training centre	Name, owner, address, location point, status, phone, photographs
Trade	Welding, tailoring, plumbing and so on	A fixed list, extended by staff, never free text
Programme	A course a provider offers	Fee, instalments, duration, weekly schedule, capacity. A provider has many
Intake	A dated start of a programme	Start date, places offered, places remaining. Drives the Starts filter
Verification	One completed check on a provider	Date, officer, what was checked, evidence photographs, outcome, expiry
GovernmentStatus	CTVET registration and accreditation as documented	Kept apart from Verification by design, and allowed to be empty
Enquiry	A trainee contacting a provider	Trainee phone, programme, intake, message, state, reference code
EnquiryOutcome	What happened to an enquiry	Replied, visited, enrolled, fee paid, completed , provider attestation . Recorded by staff or provider. The last two fields exist only to make section 08 possible
Subscription	What a provider pays and for what	Tier, price, period, state. Deliberately simple until pricing is tested

RELATIONSHIPS

```

Provider 1 ---> n Programme 1 ---> n Intake
Provider 1 ---> n Verification (history retained, never overwritten)
Provider 1 ---> 1 GovernmentStatus (optional, may be absent)
Provider 1 ---> n Enquiry 1 ---> 1 EnquiryOutcome
Provider 1 ---> n Subscription
Trade 1 ---> n Programme

```

Three structural rules

1. Verification and government status are different tables and are never joined into one displayed field. A provider can be visited by Fliiptech and have no CTVET record, or hold a CTVET registration and never have been visited. Both states must be expressible and both must render honestly. Collapsing them into a single trusted flag is the single change most likely to create a legal problem later.

2. Every change to a provider or a verification is recorded with a timestamp and an author. When a trainee disputes what a listing said, the answer has to be retrievable. This is what django-simple-history is in the dependency list for.

3. EnquiryOutcome records completion and attestation from version 1, even though nothing in version 1 reads them. These two fields are the entire foundation of employer matching, described in the next section. They cost almost nothing to capture during a conversation the field team is already having, and they cannot be recovered retrospectively. A platform that starts collecting them in year three has no graduate history until year four.

SECTION 08

Connecting trained people to employers

The investor proposal places employer and apprenticeship matching in year two. This section sets out how to reach it without building a job board, and what version 1 must capture now so that the option stays open.

Why not a job board

A job board is a two-sided marketplace stacked on top of a two-sided marketplace. It needs thousands of candidates and hundreds of employers before it is useful to either side, and Skills Hub will have neither for years. Built early it sits empty, and an empty candidate search damages the credibility of the provider search next to it.

The alternative: route hiring requests through providers

An employer needing two welders does not search a candidate database. They post the requirement, and it reaches the verified workshops teaching that trade in that area, the same workshops already listed in the marketplace. The master craft person replies with two of his graduates.

WHY THIS WORKS	DETAIL
The supply side already exists	It reuses the provider network built in year one. Nothing new has to be recruited first
It matches how hiring already happens	Employers in the trades already ask master craft persons for people. This digitises a real path rather than inventing one
The person vouching knows the candidate	A workshop owner knows who turns up, who finishes work and who can be sent to a client. No database can produce that judgement
It strengthens the paying side	Providers gain a second reason to keep a subscription, which attacks the churn risk directly
It needs no trainee accounts	No profiles, no CVs, no candidate onboarding. The graduate is contacted by the workshop that trained them

What version 1 must capture

This is the part that matters today, and it is two extra fields on a record that already exists. Both are collected during the monthly provider conversation that section 04 already requires for reporting enrolments.

FIELD	THE QUESTION ASKED	WHY IT IS THE RIGHT QUESTION
Completion	Did this person finish the programme, and when	Distinguishes a graduate from someone who enrolled and left. Without it there is no trained population, only an enrolment count
Provider attestation	Would you recommend this graduate for paid work	One question, asked of the person whose own reputation carries the answer. This is the signal no Ghanaian job board has

The reason this section sits in the data model chapter rather than the roadmap

Completion and attestation cannot be reconstructed later. A platform that begins recording them in year three has no graduate history until year four, and arrives at the employer conversation with nothing to offer. Capturing them from the first cohort costs one extra question per provider per month.

Stage two: a light graduate layer

Only once there is volume, meaning several hundred recorded completions, does a searchable graduate layer become worth building. It is deliberately thin.

ELEMENT	WHAT IT IS	WHAT IT IS NOT
Graduate record	Phone number, trade, completion date, training provider, attestation	Not a CV, not a profile, not a photograph
Opt in	The graduate consents by SMS before appearing to any employer	Never automatic from an enrolment record
Employer search	Trade, area, completion date, whether the training provider was verified	No ranking by payment, for the same reason provider search is not ranked by payment
Contact	The employer requests an introduction, and the workshop makes it	Not direct access to graduate phone numbers

How it earns

REVENUE	SHAPE	WHEN
Institutional and NGO contracts	Negotiated fee to place a cohort of beneficiaries into training and then work	First. These buyers exist already and have budget
Employer subscription	Recurring fee for posting requirements and receiving candidates	Once employers return a second time without prompting
Placement fee	One-off fee on a confirmed hire, likely shared with the training provider	Last. Hardest to enforce, because the hire happens offline

The two things that would break it

Attestation inflation. A workshop that recommends every graduate makes the signal worthless within one cohort. The counter is to track whether attested graduates remain in work after three months and let that record feed back into the workshop's own standing. That measurement is field work and it must be budgeted as such.

Speed. Employers in the informal sector often need a person this week, not a shortlist next month. If a hiring request takes four days to produce a name, employers stop posting. Response time is the metric to watch, not match quality.

Recommended position for an investor conversation

Employer matching is a credible year two extension because the provider network and the graduate record are both by-products of year one, not new investment. It should be presented as an option the architecture preserves, not as committed roadmap, until the pilot proves that providers will report completions reliably.

SECTION 09

The three workflows that matter

Onboarding a provider

STEP	WHO	WHERE
Provider identified through trade association, referral or field canvassing	Field officer	Offline
Site visit: photographs, equipment, fee schedule, owner identification	Field officer	Phone, in the back office
Draft profile created on the owner's behalf	Field officer	Back office
Verification record completed and evidence attached	Field officer	Back office
Second pair of eyes approves publication	Operations lead	Back office
Owner sent a WhatsApp link to review their own listing	Automatic	WhatsApp
Listing goes live	Automatic	Public site

The back office must work on a phone over a mobile connection, with photographs uploading in the background. This is a specific requirement, not a general aspiration, and it should be tested on a real handset in the field before the pilot opens.

Handling an enquiry

STEP	DETAIL
Trainee submits the form	Phone number, chosen programme, chosen intake, optional message
Number confirmed by one-time code	Stops spam and gives a reachable contact
Provider alerted	WhatsApp message, with SMS as the fallback
Trainee receives a reference	Quotable on a phone call
Conversation continues on WhatsApp	Outside the platform, by design
Outcome recorded later	By the provider in their dashboard, or by staff during the monthly check

Keeping listings honest

TRIGGER	ACTION
Every 90 days	Provider prompted by WhatsApp to confirm fees and intake dates
No confirmation after 30 days	Listing marked as unconfirmed, with the date last checked shown
Verification older than 12 months	Flagged in the back office for a repeat site visit
Complaint received	Listing can be suspended immediately by staff, with the reason logged

A directory dies from staleness rather than from lack of features. These three rules are the difference between a marketplace and an abandoned spreadsheet, and they are the reason celery and django-celery-beat appear in the dependency list.

SECTION 10

Requirements that are easy to forget

AREA	REQUIREMENT	WHY
Page weight	Under 200 kilobytes for a search result page, images excluded	Prepaid data is a real cost to the target user
First paint	Under 3 seconds on a mid-range Android over 3G	The most common device and connection in the market
Images	Served as WebP, sized for the device, loaded lazily	Provider photographs are the heaviest thing on the page
Poor connections	Failed requests retry, and forms retain what was typed	Connections drop mid-form and the enquiry must survive it
Data protection	Registration with the Data Protection Commission, a published privacy policy, and minimal collection	The platform holds phone numbers of people who are often young
Trainee data	Phone number and enquiry history only, no identity documents	Anything not collected cannot be leaked
Provider evidence	Identity documents stored privately, never publicly served	Verification evidence is not public content
Accessibility	Legible contrast, tap targets of at least 44 pixels, keyboard focus visible	Also improves usability in sunlight and on cracked screens
Language	English at version 1, with the interface strings externalised	Twi and Ga become possible later without a rewrite
Backups	Nightly database backup held off the server, restore tested once	An untested backup is not a backup

SECTION 11

Build order

The sequence matters more than the estimates. Each stage produces something that can be shown to a provider or a trainee and argued with.

STAGE	BUILT	DONE WHEN
1. Foundation	Django project, database with PostGIS, data model, admin configured, deployment pipeline	A staff member can create a provider record and see it saved
2. Back office	Provider onboarding on a phone, photograph upload, verification records, approval step	A field officer completes a real provider during a real site visit
3. Public site	Next.js frontend, search, filters, provider profile, area pages	Thirty real providers are live and findable
4. Enquiries	Enquiry form, one-time code, WhatsApp alerts, reference codes	A real trainee reaches a real workshop through the platform
5. Map and dashboard	Map view with clustering, provider dashboard, outcome recording	A provider can see their own enquiry numbers
6. Freshness and scale	Scheduled confirmation prompts, staleness flags, caching, monitoring	Listings stay current without anyone remembering to check

What to build first if the budget is cut

Stages 1 and 2 alone produce a verified provider database with a back office. That has value on its own: it can be sold to an NGO placing beneficiaries, and it is the asset that makes the marketplace possible later. Stage 3 without stage 2 produces a website that nobody can keep up to date, which is the more common and more expensive failure.

A note on sequencing against the investor proposal

The proposal's roadmap puts the MVP in months two to four and verification in months five to six. That ordering should be reversed. Verification is not a later feature, it is the product's only defensible claim, and building the listing without the checking produces a directory that competes with Facebook on Facebook's terms.

SECTION 12

What this design does not solve

Recorded plainly, because a specification that only lists strengths is not useful to the person paying for the build.

OPEN PROBLEM	CURRENT POSITION
Leakage. A trainee finds a workshop and calls the number directly, and the platform never sees the enrolment.	Accepted. It is why revenue rests on subscriptions rather than transaction fees. It is also why enrolment numbers must be collected by asking, and why that is field work rather than software.
Staleness. Fees and intake dates go out of date faster than providers update them.	Partly handled by scheduled prompts and unconfirmed flags. It remains the largest ongoing operating cost and it does not go away.
Verification does not scale. Site visits are the whole trust proposition and they cannot be automated.	No software answer exists. It caps how fast the provider base can grow honestly, and that cap should be stated openly to investors rather than discovered by them.
Willingness to pay is untested. The tiers shown in the dashboard are hypotheses.	The proposal already commits to testing pricing with the first fifty providers. The subscription table is deliberately simple so that pricing can change without a rebuild.
Demand is unproven. No amount of interface design substitutes for the provider and trainee interviews that have not yet happened.	This document assumes those interviews will happen before the build starts. If they do not, the risk is not that the software is wrong, it is that it is unnecessary.

Decisions needed before a developer starts

DECISION	WHO DECIDES
Whether the interviews in the founder action plan happen first	Founder
Whether long-term maintenance stays with the original developer or moves to a local contractor	Founder, and it changes the backend recommendation
Final brand name and domain	Founder, pending the ORC name search
Which six trades launch, and which areas of Greater Accra	Founder with the field team
Whether providers are charged anything during the pilot	Founder
Who performs verification, and what evidence is mandatory	Founder with the operations lead

Prepared as a working document. The interface shown is a design proposal and is expected to change once real providers and real trainees have used it. Figures, provider names and photographs in the mockups are illustrative.
